## ATRON ATCS-RX - Control Centre 4.0: Automated workflows, mobile use, maximum user experience

MONITORING operations status is a must for dispatchers. The new ATRON ATCS-RX web-based control centre has intuitive user guidance and a very modern, user-friendly interaction design. This mobile solution offers maximum flexibility for the control system and the dispatchers. No complex configuration of the PC workstation is needed in the control centre.

The software runs on many devices, such as tablets and smartphones, and lets dispatchers work independently of location, for example during night shifts.

With a few clicks, various different views can be accessed and also shown in multiple browser windows at the same time. The most important

dispatcher information is permanently visible. Filter functions allow individual configuration of what information is necessary.

The workflow-based event handling distinguishes between automatic events (like emergencies) and manual events (like a vehicle arriving late), and provides efficient processes. The necessary response measures can be individually configured for each event, if wanted.

The open software architecture with web interfaces offers the possibility of communication with other systems by using defined API interfaces. This ensures an easy integration of various providers like car-sharing or bike rental, and provides optimal journey planning and transfer synchronisation.
